1 Introduction

How to add a new Activity in android App.

2 Start the new Activity

1. Create a new Activity and its layout.
2. Create a new Intent, with context the actual activity and the otherActivity.class.

```
1  /*
2  * Here, we create the Intent that will start the Activity we
   specified above in
3  * the destinationActivity variable. The constructor for an Intent
   also requires a
4  * context, which we stored in the variable named "context".
5  */
6  Intent startChildActivityIntent = new Intent(MainActivity.this,
   ChildActivity.class);
7
8
9  /*
10 * Once the Intent has been created, we can use Activity's method,
   "startActivity"
11 * to start the ChildActivity.
12 */
13 startActivity(startChildActivityIntent);
```
